

Weber Thermal-Transfer Ribbons

When you select a ribbon for your thermal-transfer printer, you're selecting one of the most important components of your entire labeling system.

Weber's long experience with thermal-transfer print technologies and compatible label materials has given us a broad understanding of exactly which ribbon is best suited for any application.

Our thermal-transfer ribbons operate with a wide variety of label printers and printer-applicators from today's leading manufacturers. Each ribbon is formulated to print high-density bar codes, text and graphics for product identification, work-in-process, inventory control, shipping and other applications.

Performance Wax Ribbons

For general labeling applications, we recommend the economical *Fastrax* ribbon. This high-performance, wax-based ribbon is compatible with Weber's extensive line of paper, film and vinyl label materials.

The perfect ribbon for everyday use, *Fastrax* is ideal for product identification, shipping applications, as well as compliance labeling. When used with Zebra, Datamax and Sato printers, the ribbon produces high-resolution bar codes, text and graphic images on blank or tinted surfaces.

Cleanmark is our resin-enhanced, wax formulation that comes with a unique Clean Start™ feature. Positioned immediately following the ribbon's leader, Clean Start acts like a printer cleaning card to remove printhead debris.

Another wax ribbon that is available is Weber's *Fastprint II* ribbon. It offers good durability and is recommended for tinted surfaces.

All of our performance wax ribbons are ideal for use with our complete line of desktop thermal-transfer printers and printer-applicator print engines.

Ultimate Durability Ribbons

Our *Ultraplate II* ribbon, recognized by Underwriters Laboratories, is ideal for electronic component labeling, outdoor or property/asset management labeling and other applications that require superior abrasion resistance. With this ribbon, which also includes the Clean Start leader, imprinted bar code labels can endure many years of exposure to heat, abrasion and repeated scanning.

Weber
Labels & Labeling Systems

Its resin base provides additional bonding to Weber's highly durable, polyester Ultraplate Select label material, available in silver, white or clear. For ultimate endurance, *Ultraplate II* ribbons and labels can be used in conjunction with Zebra, Datamax or Sato thermal-transfer printers.

Weber's wax/resin *Duraprint II* and resin *PrintGuard* ribbons offer enhanced abrasion resistance on most thermal-transfer label materials at a very economical cost. Both ribbons are highly recommended for drum labeling and other durable film label applications.

In-Line Package Printing

Weber offers wax/resin and full resin *EasyPrint* ribbons for use with our EasyPrint thermal-transfer coders. These systems permit in-line coding on flexible and rigid packaging materials, such as films, Tyvek®, cartons and foil. *EasyPrint* ribbons produce high-resolution bar codes, text and graphics on both continuous and intermittent-motion systems.

Color Ribbons

Weber offers an array of colors in wax, wax/resin, and resin formulations for standard and near-edge printers. You can employ color to improve the appearance of your packaging, streamline your operation with color-coding, and aid in keeping your preprinted label inventory to a minimum. For additional information on what color can do for your operation, please consult your Weber account representative.

**Bar code scannability must be tested when using colored ribbons.*
