

## Copilot

The **KB5039212** update for **Windows 11** (version 22H2) was released on **June 11, 2024**. It addresses several issues and brings new features. However, it seems that some users are experiencing font-related problems after installing this update. If you're encountering font printing issues, here are a few steps you can try:

1. **Check Printer Settings:** Verify that your printer settings are correctly configured. Ensure that the correct font is selected and that the printer is set up properly.
2. **Restart Your Computer:** Sometimes a simple restart can resolve minor glitches caused by updates. Restart your computer and check if the font printing issue persists.
3. **Roll Back the Update:** If the problem started after installing KB5039212, consider rolling back the update. Go to **Settings > Windows Update > View update history > Uninstall updates**, and then select the KB5039212 update to uninstall it.
4. **Check for Known Issues:** Microsoft is aware of some issues with this update, including taskbar glitches. Make sure you're running the latest version of the update, as subsequent patches may have addressed font-related problems.

Remember to back up your important files before making any changes. If the issue persists, you may want to seek additional support from Microsoft or your printer manufacturer. 😊🖨️
